

JONES® RESIDENTIAL FIRE SERVICE CONNECTION

Full Flow • Uni-cast Body

Connecting a residential service that feeds independent domestic water and fire protection systems is quick and easy with the Jones® Residential Fire Service Connection. This compact uni-cast fitting has two outlets to allow the fire sprinkler system to function normally even when the residential side has been shut off.

A 1" full port, lockable angle ball valve controls the domestic supply side, while the other side feeds water unimpeded to the fire protection system. Outlet connections feature a choice of 1" integral Jones 110® or Pack Joint CTS Compression Connections, as well as FIP which allows adapting this convenient fitting to virtually any connection type. The inlet will accept 1" or full ¾" water meters. This quality US-made fitting can be used in most meter pit installations, and is available in C89833 (low-lead) or C 83600 (85-5-5-5) copper alloys.

Save the time and cost associated with assembling a collection of separate parts, and avoid the potential for leakage from the multiple connection points involved. Specify the new Jones Residential Fire Service Connection.
